Box 519 Domingo, Carmen; San Francisco State University, Department of Biology Fernandez-Figueroa, Edna; Auburn University, Fisheries, Aquaculture, and Aquatic Sciences Nagy, Eric; University of Virginia, Mountain Lake Biological Station Steury, Todd; Auburn University, School of Forestry and Wildlife Sciences Summers, Adam; University of Washington, Friday Harbor Laboratories
Key words:	REU, researcher, assessments, field biology, ecology
Abstract:	Training in science, technology, engineering, and mathematics (STEM) is a top priority for driving economic growth and maintaining technological competitiveness. We propose that exposure to a rigorous research program as an undergraduate leads to success in a research STEM career. We compared the scientific outcomes of 88 participants from five National Science Foundation Research Experiences for Undergraduates (REU) Site programs with demographically-similar applicants to assess the impact that formal, organized, and funded undergraduate summer research experiences have on participants. Our study demonstrates that REU participants are more likely to enter a PhD program and generate significantly more valued products, including presentations, publications, and awards, relative to applicants. We believe that key components of the program, include funding for personal and professional needs, access to diverse intellectual, analytical, and field resources, and the presence of other undergraduate researchers, who continue to support each other and share their goals and interests.

4
5

6 32 Training in science, technology, engineering, and mathematics (STEM) is a top priority
7
8 33 for driving economic growth and maintaining technological competitiveness. We
9
10 34 propose that exposure to a rigorous research program as an undergraduate leads to
11
12 35 success in a research STEM career. We compared the scientific outcomes of 88
13
14 36 participants from five National Science Foundation Research Experiences for
15
16 37 Undergraduates (REU) Site programs with demographically-similar applicants to assess
17
18 38 the impact that formal, organized, and funded undergraduate summer research
19
20 39 experiences have on participants. Our study demonstrates that REU participants are
21
22 40 more likely to enter a PhD program and generate significantly more valued products,
23
24 41 including presentations, publications, and awards, relative to applicants. We believe
25
26 42 that key components of the program, include funding for personal and professional
27
28 43 needs, access to diverse intellectual, analytical, and field resources, and the presence
29
30 44 of other undergraduate researchers, who continue to support each other and share their
31
32 45 goals and interests.

3
4 **48 Introduction:**

5
6 49 Scientific, technological, and economic competitiveness is motivating greater interest and
7
8 50 investment in science, technology, engineering, and mathematics (STEM) training
9
10 51 around the world (Gentile et al. 2017), with an emphasis on addressing the current
11
12 52 shortage of STEM PhDs (Brewer et al. 2011, National Academy of Sciences 2010).
13
14
15 53 With annual spending on STEM training well over US\$14 billion in the United States
16
17 54 (US Department of Labor 2007), guiding future investments in STEM training demands
18
19 55 good understanding of effective approaches (US National Science Board 2015,
20
21 56 Hanauer et al. 2017, Lopatto 2004, Wei and Woodin 2011). For example,
22
23
24 57 undergraduate research experience is often credited with preparing students for
25
26 58 success in STEM careers (Graham et al. 2013, Kolb and Kolb 2005, US Department of
27
28 59 Labor 2007, US National Academy of Sciences et al. 2010). However, quantitative
29
30 60 assessments of STEM training are rare (Hanauer et al. 2017, Linn et al. 2015) due to a
31
32 61 variety of problems including the difficulty of tracking long-term scientific outcomes in a
33
34 62 controlled fashion.
35
36
37
38

53
54
55
56
57
58
59
60

64 Considering the global importance of sound investments of limited resources and the
65 need to identify effective models for STEM training (Barney 2017), we quantitatively
66 analyzed data from demographically matched students who participated (hereafter
67 “participants”) or applied but did not participate (“applicants”) to the same United States
68 National Science Foundation (NSF) Research Experience for Undergraduates (REU)
69 Site summer program held from 2009 to 2011. These independent and geographically
70 dispersed training programs fully support REU participants to conduct independent

1
2
3 71 research projects. Participants are awarded an NSF-defined “take-home” stipend and
4
5 72 travel and housing support. During fiscal years 2015-2017 NSF REU Site programs
6
7 73 across the entire Foundation spent more than \$185M across more than 500 grants, and
8
9 74 trained over 150,000 REU participants (grant data available at
10
11 75 https://www.nsf.gov/funding/pgm_summ.jsp?pims_id=5517).
12
13

14 76 In this study, we use 88 participant-applicant pairs of undergraduate students
15
16 77 associated from five field biology-based REU Sites supported by NSF to determine the
17
18 78 impact of structured research experience on future STEM productivity (measured as the
19
20 79 number of scientific presentations, publications, merit-based academic awards as well
21
22 80 as the terminal degree pursued; see data available in *Supplementary Information*).
23
24
25

26 81

27 82 **Methods:**

28 83 ***Participant and applicant information***

29
30
31 84 Participant and applicant data from five field-based NSF REU Site programs held during
32
33 85 summer 2009 (three Sites, 23 student pairs), 2010 (three Sites, 22 student pairs), and
34
35 86 2011 (five Sites, 43 student pairs) were collected from REU grant principal investigators
36
37 87 (see *Supplementary Information*). A “participant” is defined as a student who was
38
39 88 admitted and who successfully completed the program. An “applicant” is defined as a
40
41 89 qualified undergraduate student who applied for admission to one of the participating
42
43 90 REU Site programs, but was not admitted. Each student (participant and applicant) was
44
45 91 tracked between 5 and 7 years post-REU experience. To account for this variation in
46
47 92 time, paired (participant and applicant) data were treated as a random factor in our
48
49 93 statistical analyses. For each REU Site, a demographically-similar (i.e., gender, race,
50
51
52
53
54
55
56
57
58

1
2
3 94 ethnicity, age, home institution type (private or public) and size, major, focus area, and
4
5 95 grade point average) applicant was paired with an REU participant (see *Supplementary*
6
7 96 *dataset A*).
8
9

10 97

11 12 98 **Measured outcomes**

13
14 99 Five individual-specific outcomes were considered in this study, including (#1) general
15
16
17 100 field of study (STEM or non-STEM; Figure 1A) and (#2) highest degree pursued
18
19 101 (doctorate (PhD), healthcare (e.g., Doctor of Medicine, Doctor of Veterinary Medicine,
20
21 102 Doctor of Pharmacy), masters of science (MS), masters of business administration
22
23 103 (MBA), bachelor of science (BS), associate of arts (AA), and high school (HS); Figure
24
25
26 104 1B) and number of (#3) scientific presentations and (#4) publications and (#5) academic
27
28 105 awards (Figure 2; see *Supplementary data*). Information for outcomes was collected
29
30
31 106 using a combination of REU Site PI tracking data, social media (i.e., LinkedIn,
32
33 107 Facebook, Google Scholar), and internet searches. Identities of each student were
34
35 108 confirmed by name, undergraduate institution, and year of graduation. Pairs were
36
37
38 109 included in our analyses only if all data were available for both members of the pair.
39
40 110 Publications were counted if they were published in a scientific journal. Scientific
41
42 111 awards (including grants) associated with merit and related to scientific contributions
43
44 112 were counted. GPA related awards, such as Dean's List, were not included. Finally,
45
46
47 113 presentations (including oral and poster formats) were counted if they were scientific in
48
49 114 nature.
50

51 115

52 53 54 116 **Statistical analyses**

1
2
3 117 Chi-square tests were used to compare distributions of REU participants and applicants
4
5 118 according to their discipline (STEM or non-STEM, Figure 1A) and terminal degree
6
7 119 pursued (Figure 1B). No statistical difference was observed between REU participants'
8
9
10 120 and applicants' current discipline (STEM or non-STEM; Figure 1A, chi-square $P =$
11
12 121 0.214) or terminal degree types pursued (Figure 1B, chi-square $P = 0.135$). However,
13
14 122 REU participants pursued more PhD and less MS degrees than applicants (Figure 1B,
15
16 123 chi-square $P = 0.018$). Given that chi-square tests tend to perform poorly with limited
17
18 124 data for a specific group (e.g., $n < 5$), another chi-square test was conducted without
19
20 125 including data for MBA, AA, and HS degrees. This analysis with fewer degree
21
22 126 categories also showed no significant differences between REU participants and
23
24 127 applicants (Figure 1B, chi-square $P = 0.097$).
25
26
27
28
29
30

31 129 A generalized linear mixed model fit by maximum likelihood (Laplace approximation)
32
33 130 with Poisson distribution and "Pair" as a random factor was used to compare the
34
35 131 scientific outcomes (i.e., presentations, publications, or awards) of de-identified,
36
37 132 demographically paired NSF REU participants and applicants (main effect = REU
38
39 133 experience). The REU experience effect is interpreted as the multiplicative increase in
40
41 134 scientific productivity an REU participant exhibits relative to the demographically-similar
42
43 135 applicant. Thus, an "REU effect" where the 95% confidence intervals include 1
44
45 136 indicates that paired students had statistically similar outcomes. An REU effect > 1
46
47 137 (lower 95% confidence interval > 1) indicates that an REU applicant was more
48
49 138 productive than a paired applicant.
50
51
52
53
54 139

1
2
3 140 Although we were not interested in evaluating differences across the five REU Sites
4
5 141 included in this study, we conducted an additional generalized linear mixed model
6
7 142 analyses including REU experience, Site, and REU experience x Site interaction for the
8
9 143 three primary outcomes (presentations, publications, and awards) for thoroughness
10
11 144 (see *Supplementary dataset B*). In general, our findings from these additional analyses
12
13 145 were consistent with our primary analyses (presented in Figure 1B). For example, all
14
15 146 three of the analyses showed significant REU experience effects (all $P \leq 0.024$). We did
16
17 147 find significant Site x REU experience interactions for all three outcomes (all $P \leq$
18
19 148 0.0074). However, for all Sites and outcomes except one (publications at Site C), the
20
21 149 estimated effect of the REU experience was positive (albeit not always significantly so).
22
23
24
25

26 150
27
28 151 Chi-square and generalized linear mixed model statistics were conducted using the
29
30 152 base package of R and the *glmer* function in the *lme4* package of R (Bates et al. 2015),
31
32 153 respectively.
33
34

35 154
36
37 155 De-identified data associated with REU participant and applicant pairs are available in
38
39 156 the *Supplementary information*. Requests for additional information about this study can
40
41 157 be made directly to the corresponding author, Alan Wilson, at wilson@auburn.edu
42
43
44

45 158

46 159 **Results:**

47
48
49 160 As a group, applicants to, and participants of, NSF REU Site programs are similarly
50
51 161 biased toward selecting STEM field careers (Figure 1A; chi-square $P = 0.214$).
52

53
54 162 However, REU participants are 48% more likely to pursue PhDs than applicants (Figure
55
56
57
58

1
2
3 163 1B; chi-square $P = 0.018$). This result alone supports the hypothesis that structured
4
5 164 independent undergraduate research experience is an important stepping stone to a
6
7 165 STEM terminal degree. Additionally, of the REU participants included in our analyses
8
9 166 who provided demographic information (gender 72%; race 75%), females and under-
10
11 167 represented minorities (including African-Americans, Hispanic Americans, and Native
12
13 168 Americans) accounted for 57% and 42%, respectively. Further diversification is
14
15 169 generated from NSF's expectation that REU participants will be selected from a broad
16
17 170 range of schools, especially institutions with limited research opportunities. Typically,
18
19 171 PhD students come from research intensive public universities or private liberal arts
20
21 172 colleges (Fiegenger and Proudfoot 2013). Thus, these results suggest an important
22
23 173 broader impact of REU programs; namely that they serve as a powerful tool for
24
25 174 supporting the economic and cultural diversification of Ph.D.-level scientists.
26
27
28
29
30

31 175
32
33 176 Potentially as a result of an increase in advanced degrees pursued by REU participants,
34
35 177 we found that participation in REU Site programs was also effective at boosting
36
37 178 research productivity (Figure 2). For example, REU participants produced 2.14 times
38
39 179 and 1.58 times as many scientific presentations and publications, respectively, and,
40
41 180 earned 1.37 times as many academic awards than applicants (Figure 2D; generalized
42
43 181 linear mixed model all $P \leq 0.012$). Considering that these outcomes are central forms of
44
45 182 intellectual currency and indicators of future success in STEM (Laurance et al. 2013,
46
47 183 Morales et al. 2017), our findings suggest that there are both short-term (products) and
48
49 184 long-term (careers) benefits to participating in NSF REU Site programs. We did find a
50
51 185 significant interaction between the REU experience and REU Site program location (any
52
53
54
55
56
57
58

1
2
3 186 of the five participating programs, see *Supplementary dataset B*). However, the effect
4
5 187 of REU experience was estimated to be positive across almost all REU Sites and
6
7
8 188 outcomes, suggesting that the REU experience, in general, drives the patterns we
9
10 189 observed despite variation in program location, management, and implementation.
11

12 190

13
14
15 191 **Discussion:**

16
17 192 Our quantitative results show the potential effectiveness of undergraduate research
18
19 193 experiences (Figure 2) are consistent with earlier qualitative (Linn et al. 2015, Lopatto
20
21 194 2004) and quantitative findings (Hanauer et al. 2017)– structured independent research
22
23
24 195 training is hugely effective at cultivating future scientists. However, an important
25
26 196 question remains – Why do these experiences work? (Gentile et al. 2017) In general,
27
28 197 NSF REU Sites provide structured and fully funded research experiences for student
29
30
31 198 cohorts (~8-10 students) for several weeks (~8-10 weeks per summer) where REU
32
33 199 participants collaboratively work with a senior scientist with an active research program
34
35 200 and peer scientists while participating in a variety of professional development
36
37
38 201 enrichment activities, such as learning to read research articles, presenting oral or
39
40 202 poster presentations, preparing applications for graduate school, and networking with
41
42 203 other scientists. All or some of these training characteristics could explain our findings
43
44 204 (Abudayyeh 2003, Auchincloss et al. 2014, Fox et al. 2017, Linn et al. 2015, Morales et
45
46 205 al. 2017, Rocchi et al. 2016, Shanahan et al. 2015, Taraban and Logue 2012).

47
48
49 206 Nonetheless, NSF REU Sites are not prescribed. Instead, REU PIs have significant
50
51 207 flexibility in leveraging available laboratory, analytical, field, and human infrastructure to
52
53
54 208 create the most impactful experiential learning for their REU participants. Therefore,
55
56
57
58

1
2
3 209 despite variation across NSF REU Sites in their research, professional development,
4
5 210 and networking activities, we found strong effects of NSF REU experiences (Figure 2D).
6
7 211 These findings are even more impressive considering that our comparison of paired
8
9 212 participants and applicants to the same REU Site did not exclude applicants who
10
11 213 conducted other undergraduate research, including participating in other NSF REU
12
13 214 Sites or similar programs. Thus, our analyses may actually underestimate the impact of
14
15 215 participating in undergraduate research programs, in general. Given the positive
16
17 216 impacts of undergraduate research, we argue for continued investment in such
18
19 217 programs, including making certain they are available to all demographic groups
20
21 218 (Economy et al. 2014, Linn et al. 2015, MacLachlan 2012, US National Academy of
22
23 219 Sciences et al. 2010), as a way of maintaining a strong, global STEM workforce.

1 **Supplementary information:**

2 Supplementary dataset A: De-identified REU participant and applicant dataset, including
 3 year of REU experience, Site IDs (A-E), pair # (1-88), REU participant code
 4 (0=applicant, 1=participant), individual-specific number of scientific presentations,
 5 individual-specific number of scientific publications, and individual-specific number of
 6 academic awards.

Supplementary dataset B: Output from generalized linear mixed models fit by maximum likelihood (Laplace approximation) with Poisson distribution and “Pair” as a random factor that include REU experience, Site, and Site by REU experience interaction for each outcome. These statistics were conducted using the *glmer* function in R version 3.1.1. *P-values* are from Type II Wald Chi-square tests calculated using the ‘Anova’ function from the ‘car’ package.
